Project Title

Library Book Management System (LBMS) Real World Problem

***Real World Problem**

**Many small libraries still use notebooks or paper records to manage books and borrowers.
This creates several problems:**

--Books are easily misplaced.

--It is difficult to know who borrowed a book.

--Late returns are hard to track.

--Duplicate book records may exist.

--Reports take a long time to prepare.

***Proposed Solution**

**Develop a Library Book Management System using Oracle Database and PL/SQL that
allows the library to:**

--Register books

--Register members

--Borrow books

--Return books

- Calculate fines for late returns
- Rank the most borrowed books

***Objectives**

The system should:

- Store book information
- Store member information
- Record book borrowing
- Record returned books
- Calculate fines
- Generate reports
- Display the most borrowed books
